

## ***Chapter 25 — synthesis in action***

---

Exemplary syntheses of important compounds:

Saccharin (reactions of sulfonyl groups)

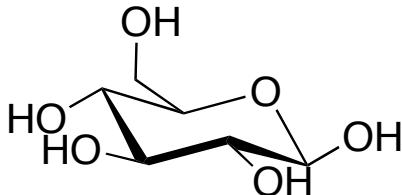

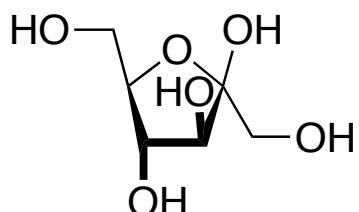

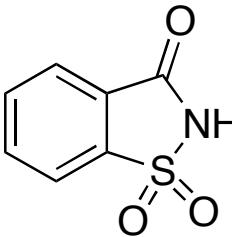

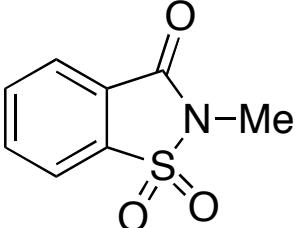

Salbutamol (Friedel-Crafts, benzyl protecting group)

Thyroxine (nucleophilic aromatic substitution, diazonium chemistry)

Peptides and proteins

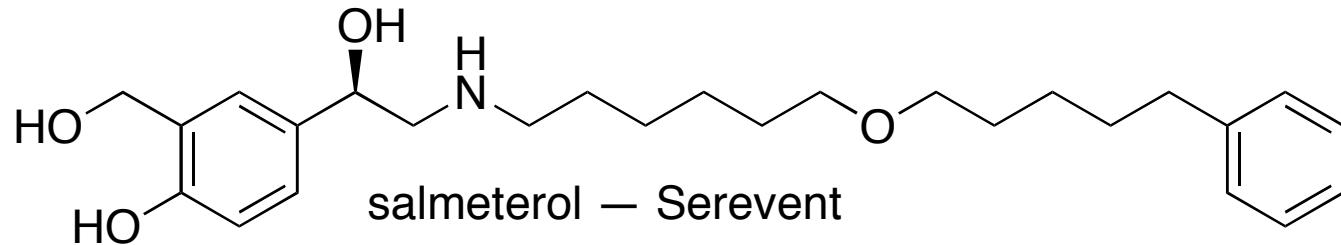

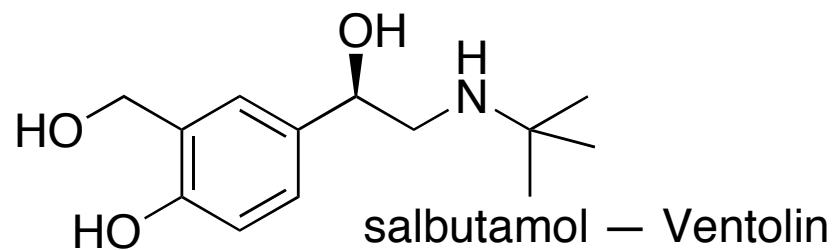

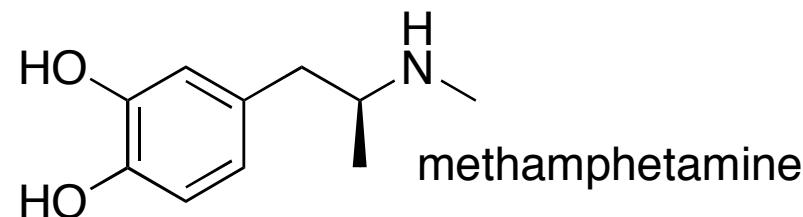

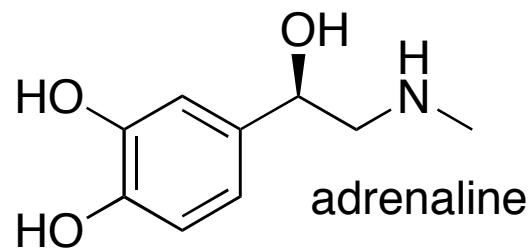

Completing our table of protecting groups (more for amines and carboxylic acids)

## ***Sweetness and chemical structure***

“Relative sweetness” (Sucrose = 100)		
glucose		70
fructose		140
saccharin		~ 28000
N-methyl saccharin		not sweet

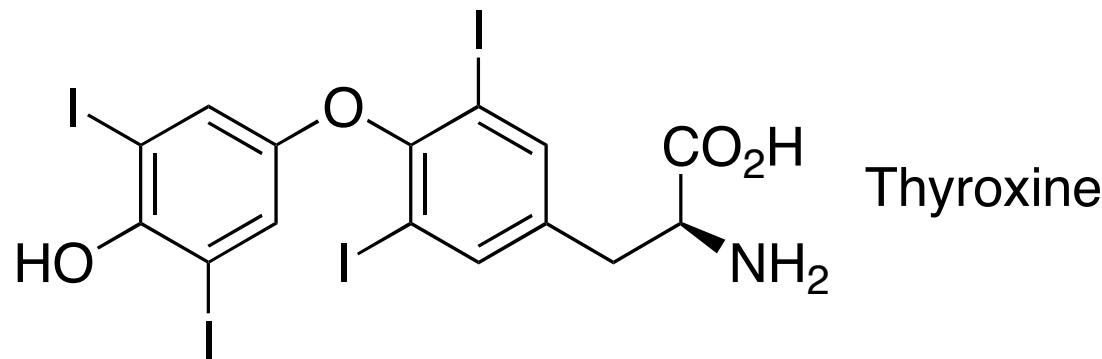

## Asthma drugs — bronchodilators

---

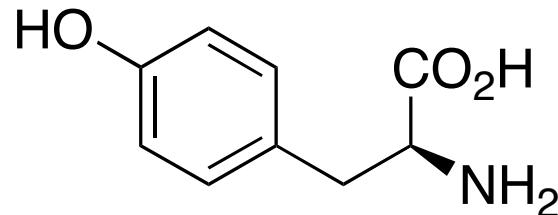

## ***Thyroid hormone — Thyroxine***

---

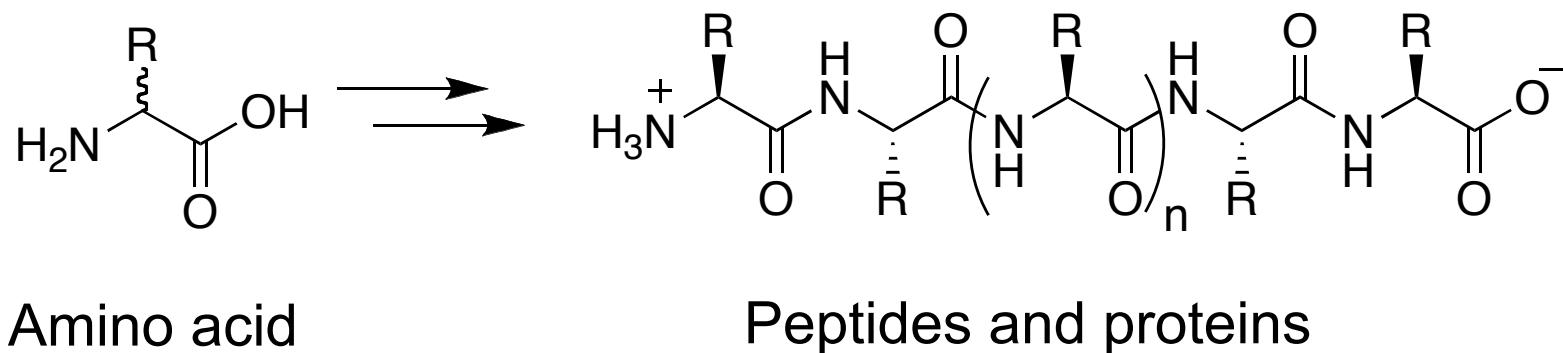

Thyroxine

Tyrosine — an amino acid

## *Peptides and proteins — polymers of amino acids*

---

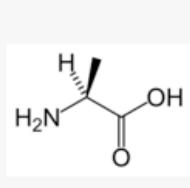

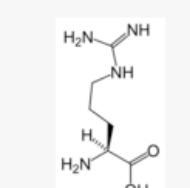

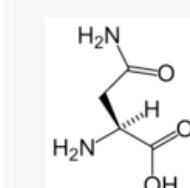

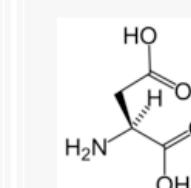

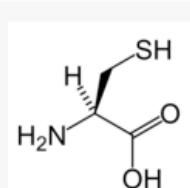

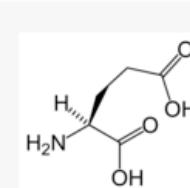

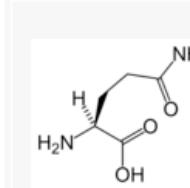

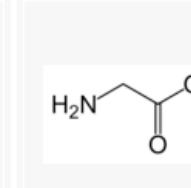

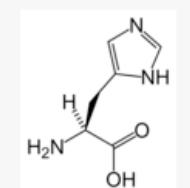

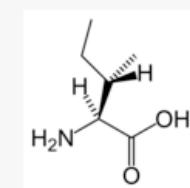

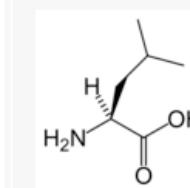

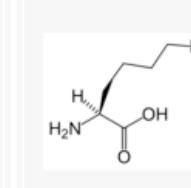

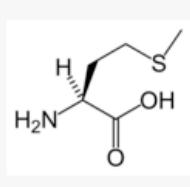

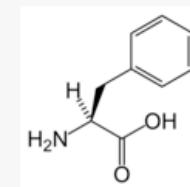

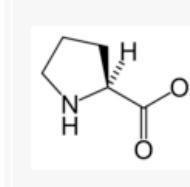

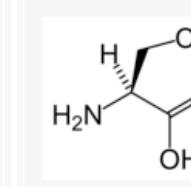

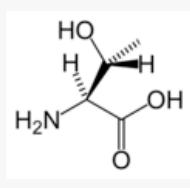

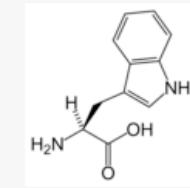

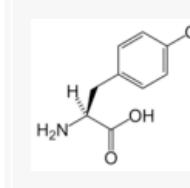

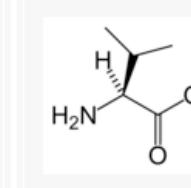

Amino acid

Peptides and proteins

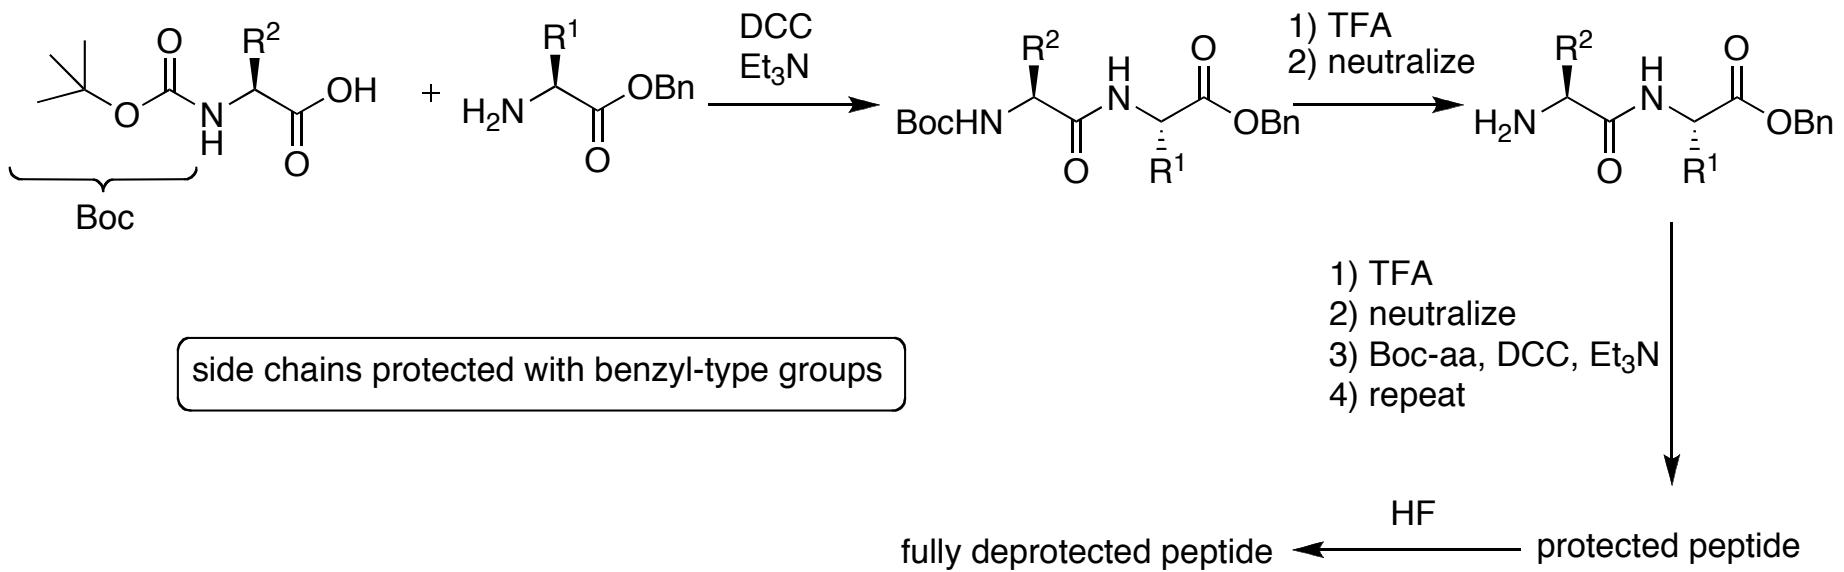

Nobel 1955: Vincent du Vignaud

First chemical synthesis of a polypeptide hormone (insulin)

# The 20 natural amino acids

 L-Alanine (Ala / A)	 L-Arginine (Arg / R)	 L-Asparagine (Asn / N)	 L-Aspartic acid (Asp / D)
 L-Cysteine (Cys / C)	 L-Glutamic acid (Glu / E)	 L-Glutamine (Gln / Q)	 L-Glycine (Gly / G)
 L-Histidine (His / H)	 L-Isoleucine (Ile / I)	 L-Leucine (Leu / L)	 L-Lysine (Lys / K)
 L-Methionine (Met / M)	 L-Phenylalanine (Phe / F)	 L-Proline (Pro / P)	 L-Serine (Ser / S)
 L-Threonine (Thr / T)	 L-Tryptophan (Trp / W)	 L-Tyrosine (Tyr / Y)	 L-Valine (Val / V)

## The Boc/benzyl method of peptide synthesis

need to use pure HF in special teflon vessels to cleanly remove benzyl-type protecting groups

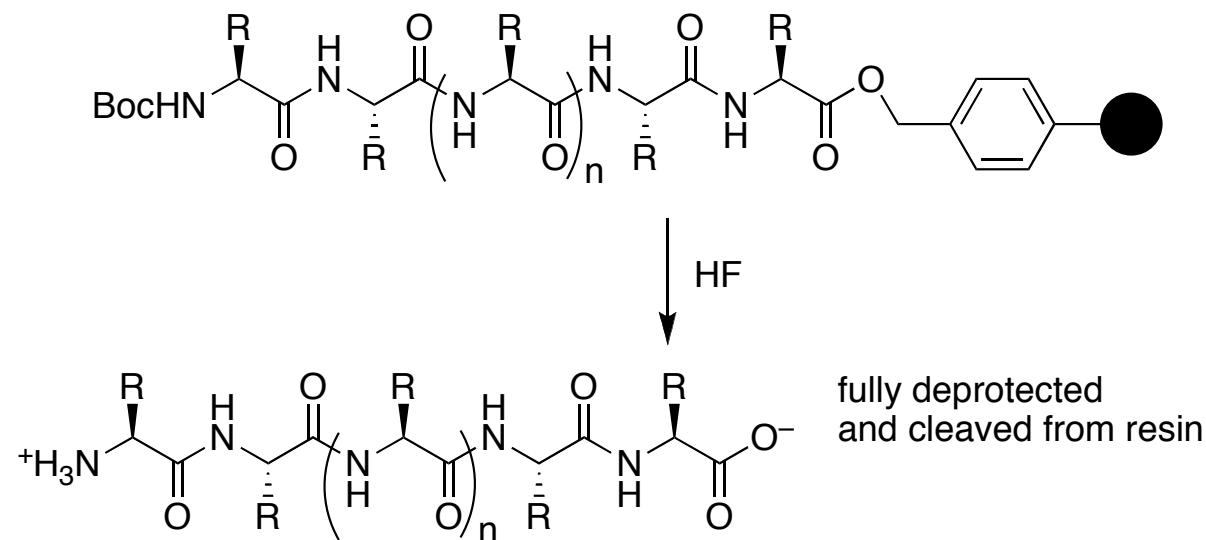

# *Solid phase peptide synthesis*

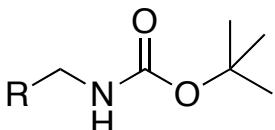

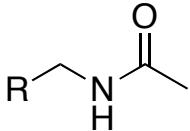

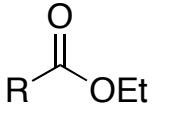

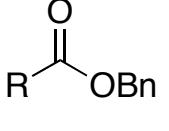

Insoluble polymer resin greatly  
simplifies workup and purification.  
Just filter to remove excess reagents

- 1) TFA  
2) neutralize  
3) Boc-aa, DCC, Et<sub>3</sub>N  
4) repeat

Nobel 1984:  
Robert  
Merrifield

## Protecting groups 2.

Name		Addition	Protects from	Removal
t-butoxycarbamate (Boc)	$\text{R}-\text{NH}_2$	$\xrightarrow{\text{Boc}_2\text{O}, \text{Et}_3\text{N}}$		protects amines from bases, nucleophiles, and electrophiles
acetamide	$\text{R}-\text{NH}_2$	$\xrightarrow{\text{Ac}_2\text{O}, \text{Et}_3\text{N}}$		protects amines from bases, nucleophiles, and electrophiles
alkyl ester	$\text{R}-\text{COOH}$	$\xrightarrow{\text{EtOH}, \text{H}^+, -\text{H}_2\text{O}}$		protects carboxylates from anhydrous acids and bases, weak nucleophiles
benzyl ester	$\text{R}-\text{COOH}$	$\xrightarrow{\text{K}_2\text{CO}_3, \text{BnBr}}$		protects carboxylates from anhydrous acids and bases, weak nucleophiles
